

MedTrack DV

Hospital Operations & Patient Analytics Dashboard

Milestone 2 — Dashboard Storyboard

1. Project Overview

MedTrack DV presents hospital patient information through planned interactive dashboards. The project focuses on treatment costs, length of stay, readmissions, patient outcomes and satisfaction.

2. Dataset Overview

The current dataset contains 984 patient records and 10 fields: Patient_ID, Age, Gender, Condition, Procedure, Cost, Length_of_Stay, Readmission, Outcome and Satisfaction.

3. Key Performance Indicators

The KPI script calculates total patient records, total treatment cost, average treatment cost, average length of stay, readmission rate and average patient satisfaction. These values should be validated against the source data before final reporting.

4. Dashboard Design

Dashboard 1: Executive Overview

Purpose: Provide a high-level summary of the dataset. Planned visualizations include KPI cards, patient distribution by gender and condition, and patient outcomes.

Dashboard 2: Patient Analytics

Purpose: Explore patient characteristics and outcomes. Planned visualizations include age and gender distribution, condition and procedure comparisons, readmission analysis, satisfaction analysis and outcome distribution.

Dashboard 3: Financial & Operations

Purpose: Analyze treatment costs and length of stay. Planned visualizations include total and average treatment cost, costs by condition or procedure, length of stay by condition, and comparisons between cost and length of stay.

5. Filters and Navigation

Potential filters include Gender, Condition, Procedure, Readmission and Outcome. Filters should update the relevant charts consistently. Navigation buttons can help users move between the three dashboards. Confirm implemented features in the final workbook.

6. Design Principles

Use consistent colors, readable titles, clear labels, prominent KPI cards, suitable charts and uncluttered layouts. Test calculations, filters and navigation before delivery.

7. Data Limitations

The current dataset does not include bed capacity or occupied-bed counts, so bed occupancy and bed utilization cannot be calculated from these fields alone. Total treatment cost should not automatically be interpreted as hospital revenue.

8. Expected Outcome

The dashboard is intended to help users explore patient records, treatment costs, length of stay, readmissions, outcomes and satisfaction. Final results depend on validating the data and testing the completed Tableau workbook.
